BREAST REDUCTION

What is Gynaecomastia ?

Gynaecomastia, or male breast enlargement is a very common condition affecting 25-30% of men of all ages. Gynaecomastia is a source of social embarrassment and distress to the affected men. Gynaecomastia is easily and permanently treated with a simple surgery, which can be done as a daycare procedure. You can get your surgery done in the morning and be discharged home by afternoon, without the need for any overnight admission. You can resume all daily activities the next day. And you don't have to be embarrassed ever again to take your shirt off. Surgery is the only treatment for gynecomastia.

Cause: Gynaecomastia occurs due to -

1. Increased breast tissue
2. Excess fat deposition

Gynaecomastia is seen physiologically in neonates, due to mothers hormones in their blood, in adolescence around puberty, and in the elderly. This is the most common cause of gynecomastia i.e. a part of normal development. It occurs due to change in the circulating hormone levels in blood which lead to increase in size of the breast tissue and fat deposition.

Other causes of gynecomastia which are relatively uncommon are steroid intake, liver diseases, testicular cancer or drug intake, to name a few.

BENEFITS OF GYNAECOMASTIA

PHYSICAL APPEARANCE :

NATURAL

Gynaecomastia surgery produce results that blend extremely well with a patient's body aesthetics. Soon after the surgery, one gets back to the desired or normal shape of a treated body part. One does not have to wait long to see the result, which is the beauty of cosmetic surgery.

INCREASED CONFIDENCE AND ENHANCED MENTAL HEALTH :

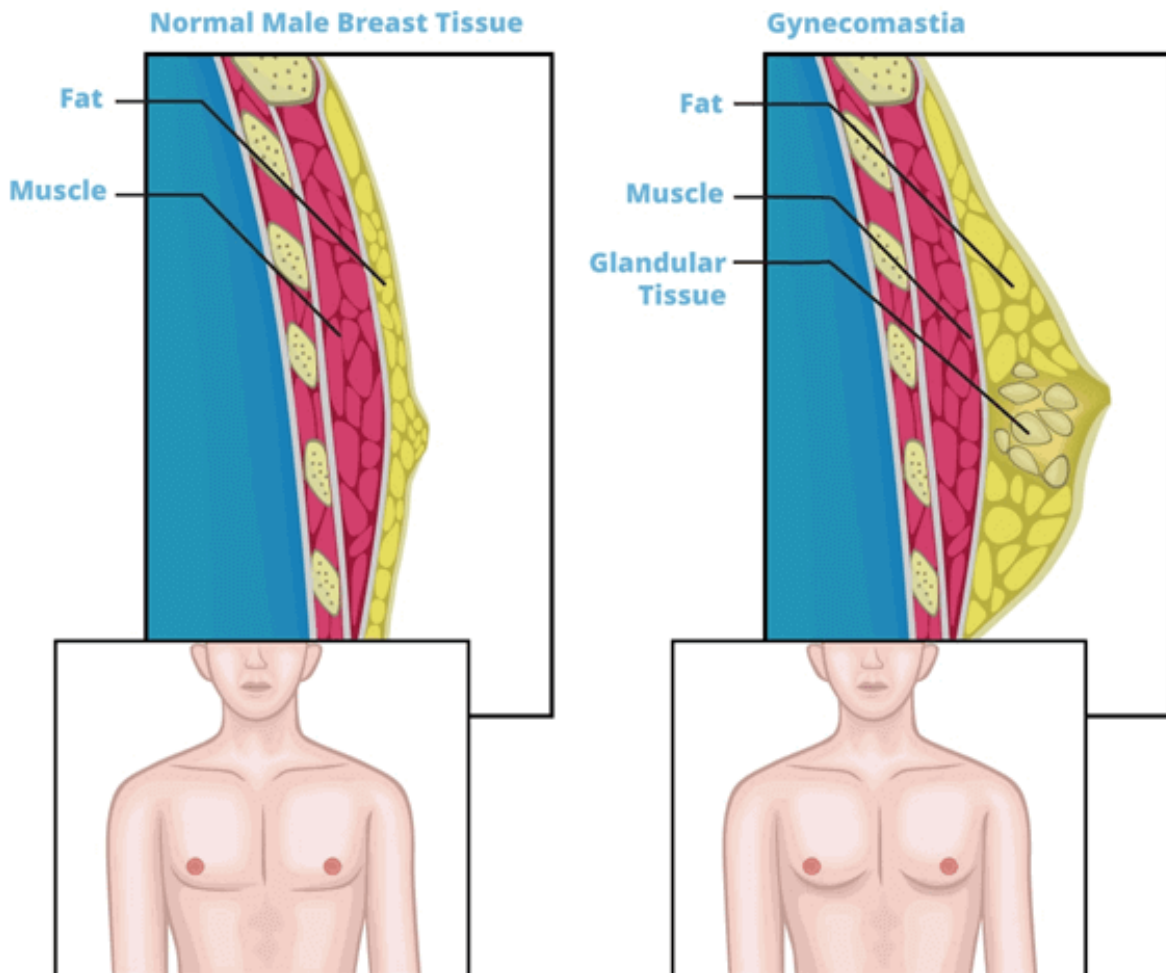

Self Confidence is a tool that helps us face challenges and tackle problems in life, with great certainty. When you look good, you feel good which in turn increases your self confidence. It leads to greater willingness to try new things or open up in social situations. You become more willing and open to wearing certain clothes or participating in activities which you avoided prior to surgery, due to discomfort in your appearance.

Certain clinicians and psychologists feel, few corrections in your body parts, by cosmetic surgery can not only lead to emotional wellness but also enhanced mental health.

GYNAECOMASTIA SURGERY PROCEDURE

How Gynaecomastia Surgery is performed ?

Surgery is the only treatment for gynaecomastia. We need to take care of both, the enlarged gland, and the excess fat. The excess fat deposition is reduced with liposuction and the gland is removed from a 1cm incision in the areola (trans areolar approach), which on healing leaves behind an almost invisible scar. Hence the entire procedure is done rapidly with no marks over the chest. Depending on the size, gynaecomastia is graded from I to IV and a separate category of pseudogynaecomastia includes breast enlargement due to fat deposition as a result of obesity.

ABOUT CLINIC
